Thanks for filling out [Project Plan Submission Form](#)

Here's what was received.

Project Plan Submission Form

This form is for submitting your Project Plan for your capstone project for Code Louisville or Code Kentucky. Please note: This is NOT the form used to submit your final capstone project. The final capstone project submission form will be posted in Google Classroom at a later date.

This form is Due 11:59 PM EST Sunday 2/23/25.

Capstone Project Proposal

Project Title *

Rates of Dogs Barking in Finland

Abstract:

Provide a brief overview of your project, highlighting its purpose, scope, and objectives.

*

I am analyzing data on dogs in Finland and noise complaints from dogs barking by neighborhood to determine which breed of dog causes the most public disturbance.

Problem Statement:

Describe the problem your project aims to address or the opportunity it seeks to leverage.

*

Recently, there have been several noise complaints about dogs barking in various neighborhoods around Finland. By analyzing the data on dogs in each neighborhood and enforcement reports, we can determine which dogs present a more challenging disposition in relation to various neighborhood.

Goals and Objectives:

Goal 1: State your primary goal for the project.

Goal 2: State any additional goals or objectives.

*

Primary goal: Determine which breeds are associated with the most complaints about barking.

Second goal: Determine which neighborhoods contain the most complaints about dogs barking.

Features:

Outline the main features and functionalities of your project as referenced in your Project Requirements document. Break them down into core features and stretch goals.

*

Two datasets will be used: records of animal registration in Finland & public disturbance complaints in Finland

Cleaning data by ensuring consistent values across columns, removing null values, and filtering out addresses outside of IKEA, Finland, and filtering addresses that do not have a registered dog. The datasets will be joined using pandas merge to combine the dog data with the complaint information.

Tableau will be used to create visualizations of this data.

A data dictionary of the columns used in this data will be included in the project README.

Technologies:

List the technologies, frameworks, and tools you plan to use for the development of your project.

*

Jupyter Notebooks, pandas, Tableau, git, and GitHub

Architecture:

Provide an overview of the system architecture. Please include links to any

mockups, diagrams or outline if applicable.

*

Jupyter Notebooks will be used to import, clean, and merge data using pandas. That data will then be imported into Tableau to complete the visualization project. GitHub will be used as the repository that contains my project.

Timeline:

Outline the project timeline, including key milestones and deadlines.

*

Week 1: Import data with pandas and clean datasets, create data dictionary in README

Week 2: Merge and filter datasets

Week 3: Import datasets into Tableau

Week 4: Create Visualizations in Tableau

Week 5: Write out the conclusion of analysis

Risks and Mitigation Strategies:

List potential risks or challenges that may arise during the project and strategies to mitigate them.

*

- Finland citizens may not be consistent with registering dogs with the government, those null values will be removed and noted

- Neighbors may be petty (especially if the neighbor is Felice)

- Data may not be cleaned or use any consistent values, including abbreviations. These will need to be deciphered, and if unable to, be removed

Test/Evaluation Plan:

Describe how you will evaluate the success of your project. This may include testing methods, user feedback, or performance metrics.

*

- I will be able to explain the way I did the analysis and am able to relate that information to others

- Corgis are angels

- Be able to explain how I got this result from the data, what this result can be used to accomplish, relay that to consumers
